Other effects:

Inhalation: Dusts may cause coughing and sneezing.

Ingestion: Ingestion of large quantities may cause gastrointestinal irritation, vomiting and diarrhea.

Toxicokinetics (absorption, metabolism, distribution and elimination):

A particle size distribution study has shown approximately > 50% of the particle is less than 100 µm (inhalable). As the substance is not lipophilic it would not have the potential to be absorbed directly across the respiratory tract epithelium. However the very high water solubility of the substances and the low molecular weights does indicate that it has the potential to be absorbed through aqueous pores or be retained in the mucus. Particles deposited on the mucociliary blanket will be swallowed in the mouth (ingestion). Therefore absorption from the gastrointestinal tract will contribute to the total systemic burden of the substance that is inhaled.

Orthophosphates contain ionisable groups which may aid gastrointestinal tract absorption.

The group 1i substances are very highly water soluble (>10000 mg/l) therefore should readily dissolve into the gastrointestinal fluid. Also small molecular weights (120-214), may aid the substance to pass through aqueous pores or to be carried through the epithelium barrier by the bulk passage of water.

The very high water solubility suggests that the substance is too hydrophilic to cross the lipid rich environment of the striatum corneum. Also the molecular weight of >100 and the extremely hydrophilic nature of the substance leads to the conclusion that dermal uptake of the substance will be minimal.

The results of the acute oral toxicity study in the rat showed no evidence of significant systemic toxicity; even at relatively high dose levels. This suggests that the test material is either of low toxicity or there is little absorption of the material following oral ingestion.
